Did you know that you can set up custom fonts for Misskey? If you follow [our Instagram account](#), you'll see some screenshoted posts from the Fediverse from our Misskey instance by using a custom font—that is the same one used on our website.

Now I'm wondering what would We Are Social's "Digital 2023" be if Twitter has become a mess + millions migrating and closing their accounts.

 I bet this will be the greatest digital exodus after the WhatsApp's case of Privacy Policy change in early 2021.

What's next? TikTok? [#birdsite](#)

Misskey, by default, opts using fonts which are cute and optimized for Japanese-speaking people. But unfortunately, the fonts they're using are not always available on all devices, primarily because of copyright reasons.

If that's a problem for you, or you just want to use custom fonts including accessibility-friendly ones like OpenDyslexic, you can set custom fonts to be displayed on the website.

This trick would work in most Misskey instances, including **misskey.io** and **misskey.id**. But unfortunately, this trick only works **per device**, meaning that you have to re-configure again when logging on to Misskey from another device or web browser.

To begin, go to your **Account Settings** and select **General**. Scroll down until you see the **Custom CSS** dropdown menu.

Yep, that bottom one!

From here, you can set up custom CSS to fine-tune how Misskey would look the best for your eyes. [CSS](#) itself is a computer language to let you style any websites, and every web developer today should already be familiar with the language.

Well, we use this CSS code to load our custom font, Nacelle, which is then backed with [our system font stack](#) as a fallback.

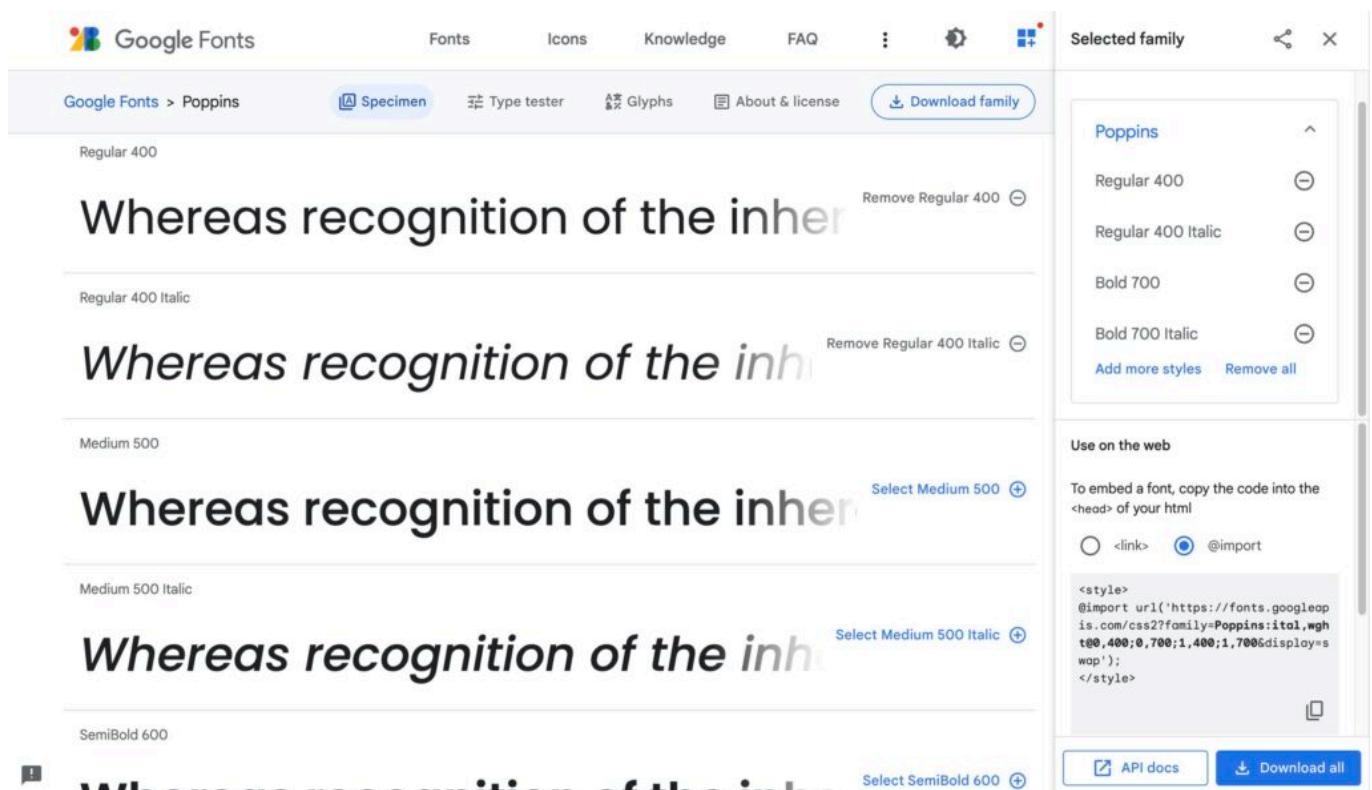

```
@import url("https://reinhart1010.github.io/nacelle/nacelle.lite.min.css");
```

```
body {
  font-family: Nacelle, "Segoe UI Variable Text", -apple-system,
  BlinkMacSystemFont, Inter, "Segoe UI", Cantarell, "Open Sans", "Noto Sans",
  Piboto, Ubuntu, "Roboto Flex", Roboto, Helvetica, FreeSans, Arial, sans-
  serif, "Apple Color Emoji", "Segoe UI Emoji", "Segoe UI Symbol", "Noto Color
  Emoji";
}
```

And of course, you can use any locally-installed fonts, like

```
body {
  font-family: "Comic Sans MS";
}
```

And if you want to use your favorite fonts from [Google Fonts](https://fonts.google.com/) instead, you can do so by selecting the font style (**Regular**, **Regular Italic**, **Bold**, and **Bold Italic** are enough) and copy the **CSS @import** code, like this:

```
/* Do NOT include the <style> and </style> tags! */
@import
url('https://fonts.googleapis.com/css2?family=Poppins:ital,wght@0,400;0,700;1,400;1,700&display=swap');
body {
  font-family: "Poppins", sans-serif;
}
```
